

Aviv® AnimalCare Ultra Powder <-----> Aviv® AnimalCare Ultra Gel

Product Description: Aviv wound care medicines are now patented, non-prescription, proprietary powder and gel formulations that provide multiple mechanisms of action when applied topically, causing several simultaneous, rapid, and safe tissue-healing effects (see 6 effects below) in a wide variety of wounds, bleeds, and localized infections and contamination. Aviv medicines have no gauze, chemotoxicities, cytotoxicities, enzymes, caustic effects, allergic reactions, and no known side effects.

Applications: Soft tissue and osteo wounds; major / deep dermal or minor / shallow, subcutaneous, or muscle and bony tissue areas with suspected or actual contamination or severe infection; areas of bleeding; both high (dry) viscosity (**Aviv Gel**) and low (wet, draining) viscosity (**Aviv Powder**) wounds.

Aviv Powder and Gel Produce 6 Key Wound Healing Effects:

- Bactericidal effect - Localized topical infections typically eradicated in 1-3 days with pathogen death in spite of resistance to antibiotics, but without tissue cytotoxicity.
 - Angiogenesis effect - New circulatory pathways are created (neovascularity), important in diabetes and compromised extremities.
 - Localized Hydration effect - Immediate fluid migration from sub-wound tissue to all of wound tissue areas.
 - Overcomes Localized Ischemia - Necrosis of tissue cells is quickly reversed and complete vitality is restored in wound area.
 - Nerve Rejuvenation effect - Restoration of nerve function has been seen in previous diabetic numbness and total loss of feeling.
 - Auto-Debridement effect - Very little need for surgical debriding. Aviv lifts thickened eschar for easy irrigating and flushing away of slough. Aviv does not create a secondary wound over the primary wound as surgical debriding typically does.
- **Apply Aviv AnimalCare Powder or Gel** topically twice daily to affected area(s) and slightly beyond the edges, saturating and covering all surface area(s) with approximately 1/8" (3.2mm) depth. **Powder** and **Gel** may be applied together for optimal consistency. If rapid absorption of Aviv is observed, more frequent applications can produce faster results.
- **Aviv AnimalCare Powder** is for low viscosity (wet / draining) localized wound conditions.
 - **Aviv AnimalCare Gel** is for higher viscosity (dry) localized wound conditions. **Please note:** The viscosity of Aviv Gel may be lower (i.e., runnier) than expected, in order to easily penetrate into affected areas. Thus, when applying to vertical or down-facing areas, position the affected area horizontally facing up as much as possible, and hold the Gel squeeze tube horizontally to apply evenly.
- There are no known side effects, allergic reactions, or drug-drug interactions with **Aviv AnimalCare Powder** or **Gel** when used as directed. Avoid contact with eyes and do not rub in the products.
